Instruction Manual CB6012A and CB6024A Battery Charger

Thank you for choosing one of our products for your work. We are certain that it will give the utmost satisfaction and be a notable help on your job and application.

Product Description

The Smart Battery Charger CB60 is available in two versions: 12V 5A and 24V 3A (5A Max). The CB60 series is a family of battery chargers based on the "Switching technology" and "Battery Care philosophy" that have been part of Adel System's know-how for 30 years. This experience has led to the development of this advanced multi-stage, fully automatic battery charger, which is suitable for meeting the most advanced requirements of battery manufacturers. The Battery Care concept is based on algorithms that implement fast and automatic charging, optimization of battery charging during all charging stages, recovery of discharged battery, and real-time diagnostics during installation and operation. The real-time diagnostics system discreetly monitors the battery disconnection, and incorrect voltage. Such faults are indicated by intuitive flashing of the diagnostic LED. Each device is suitable for all battery types: default curves can be set for open lead-acid, AGM, Gel and NiCd batteries. A rugged enclosure with bracket for DIN rail and wall mounting provides IP20 protection.

1 Safety and warning notes

WARNING – Explosion Hazard. Do not disconnect equipment unless power has been switched off or the area is known to be nonhazardous.

WARNING – Explosion Hazard. Substitution of components may impair suitability for class I, Division 2.

WARNING – Switch off the system before connecting the module. Never work on the machine when it is live. The device must be installed according to EN61010 or EN62368-1. It must be possible to disconnect the device with a suitable isolating facility outside the power supply unit. Danger of fatal Injury! WARNING – The device is equipped whit an internal fuse. If the internal fuse blows up (fails opens) most likely there is a fault in the device. If this failure occurs, the device must be returned to the factory.

2 How to Install

Fig. 1 - Drawing of the CB60 series battery chargers

2.2 Din Rail or Panel Mounting

Fig. 1 shows a dimensional drawing of the CB60. It is possible to mount the device on Din rail or panel and fix it by 2 screws 2.9x8-16. There is no limit to the Panel thickness.

2.3 How to Supply the device

The CB60 battery chargers have a single-phase input and can operate in the range 90 to 305 VAC; therefore, they are suitable for standard 110, 230 and 277 VAC systems.

2.4 Device Connection (Fig.2)

2.5 Connection terminal and wiring

	Solid (mm2)	Stranded (mm2)	AWG	Torqu e (Nm)	Stripping Length
ln:	0.2 – 2.5	0.2 – 2.5	24 – 14	0.5 – 0.6 Nm	7 mm
Out:	0.2 – 2.5	0.2 – 2.5	24 – 14	0.5 – 0.6 Nm	7 mm

Screw type terminal block, 2.5 mm². Wiring terminal shall be marked to indicate the proper connection for the power supply. For supply connections use copper cables only, use wires suitable for at least 75°C.

3 Functionality

The CB60 battery chargers implement a multi-stage battery charging technique to ensure optimal battery performance and health. An additional feature, the power function, can be activated via the user interface and allows the output voltage to be available even when the battery is not connected. Otherwise, when the battery is not connected, the battery output terminals of the CB60 are devoid of voltage.

The user interface of the CB60 charger consists of a button and a multicolor LED. It shows the activity of the device and allows you to view and change the configuration of the device. By default, the CB60 is configured to operate with an open lead-acid battery and the power function is disabled.

3.1 Charging

The normal indication of the user interface: when the battery is charging, the device signals the charging phase with a continuous GREEN flashing, with a frequency that depends on the charging phase in progress. Conversely, if a fault is active, the device displays a sequence of ORANGE flashes followed by a pause.

Device status	State	LED Diagnosis	LED Color
	Recovery	5 blinks / sec	Green
Charging	Bulk	2 blinks / sec	Green
Charging	Absorption	1 blink / sec	Green
	Float	1 blink / 2 sec	Green
	Reverse polarity or wrong battery voltage	1 blink / pause	Orange
Auto Diagnosis Fault	Battery not connected	2 blinks / pause	Orange
	Battery with shorted cells	3 blinks / pause	Orange
Tab	tivity		

Type of charging it is current-limited and constant-voltage, IUoU profile in conformity to DIN41773.

3.2 Displaying the current device configuration

While the user interface is showing the device activity, press briefly (less than 1sec) the pushbutton to display the Battery Chemistry. The device will display the chemistry by means of a number of GREEN LED blinks followed by a pause, immediately followed by the Power Supply configuration enabling status, by means of a number of RED blinks followed by a pause, according to Table 2:

	State / Type	LED Diagnosis	LED Color
	Open Lead	1 blink / pause	Green
Ob analista i	AGM Lead	2 blinks / pause	Green
Chemistry	GEL Lead	3 blinks / pause	Green
	NiCd	4 blinks / pause	Green
Power supply	Disabled	1 blink / pause	Red
function	Enabled	2 blinks / pause	Red
	Fable 2 – Device confi	guration display and pro	gram

The user interface then automatically resumes the normal display of device activity. The ongoing battery charging process is not interrupted or affected in any way during the device configuration display.

Instruction Manual CB6012A and CB6024A Battery Charger

Altech Cor

3.3 Programming the device configuration:

Note that device programming is possible only after the device is turned on, when the battery is not connected. While the user interface shows device activity, to enter programming mode, press the button for more than 2 seconds until the LED flashes ORANGE. When you release the button, the LED flashes once in GREEN followed by a pause. This means that the battery chemistry is open lead. Press the button repeatedly to scroll through the chemistries to the desired one-the LED displays a number of GREEN flashes corresponding to the chemistry according to Table 2. Confirm by pressing the button for more than 2 seconds when the desired chemistry is displayed. The LED flashes GREEN to indicate that the chemistry has been tentatively set. Note that the chemistry must be selected: a short press of the button when NiCd is displayed will restart the chemistry selection from Open Lead. After confirming the chemistry with a long press, the enabling state of the power function can be selected with the same logic, except that the LED will flash RED. When the desired option (enabled or disabled) is displayed, long press the button to confirm the selection-the LED will flash RED for confirmation.

When programming is completed, the device summarizes the new configuration as described in "Displaying the current device configuration," then resumes the normal display of device activity.

NOTE that the entire programming process must be completed in order for the configuration to be confirmed and maintained even during power-cycling. If the button is not pressed for 60 seconds during the programming process, the programming process stops and the device returns to displaying device activity without changing settings.

4 Standards and Certification

4.1 Immunity and Emission

The CE mark in conformity to EMC 2014/30/EU: Electromagnetic Compatibility Directive; 2014/35/EU: Low Voltage Directive; ROHS 2011/65/EU: Restriction of the use of certain Hazardous Substances in Electrical and Electronic Equipment (RoHS), as amended by 2015/863/EU

- EMC Immunity: EN61000-6-2
- EMC Emission: EN61000-6-3, EN 55022 Class B

4.2 Electrical Safety for mounting

According to:

- Electrical Equipment for Machinery EN 60204
- Electrical safety (of information technology equipment) IEC/EN EN62368-1.
- Safety requirements for electrical equipment for measurement, control and Laboratory use IEC/EN 61010
